Problem Statement:

Hotel Booking Automation : Developing a hotel booking automation system to streamline and simplify the process of reserving accommodations for guests. This system aims to provide a user-friendly interface for customers to search, compare, and book hotel rooms efficiently, while also offering hotel management tools to optimize inventory management, room allocation, and guest check-in/check-out processes.

Solution :

We propose developing a user-friendly web application for hotel booking automation. Users can search, compare, and book accommodations based on preferences like location, dates, and amenities. The platform will offer secure registration, seamless booking, and flexible reservation management. Hotel owners will have an intuitive dashboard to manage listings and bookings. With notification features and responsive design, the application aims to streamline the booking process and enhance user experience for travelers and hotel establishments alike.
